

CS673 Individual Status Report

Name: Joseph Rissman

Date: 04/16/2025

Team: Admissions Alchemists

Work planned for previous report:

1. Implement document generation through API webhooks.
2. Finalize document storage and retrieval in Convex.
3. Fix bugs with search bar and pagination.
4. Deploy Convex and Clerk databases to the production environment.

Work completed since last report:

1. Implemented the `getProgram` query to fetch program details by ID, including error handling for non-existent programs.
2. Added the `getRecommender` query to obtain recommender information for letters of recommendation, with validation for document type and existence of recommender details.
3. Addressed issues with the `useApplicationDetails` hook, resolving problems related to conditional logic and multiple returns.
4. Refactored queries to replace hardcoded values with constants for AI credits and loading delay, improving code maintainability.
5. Refactored API import paths to use a new alias ("`#`") for improved readability and maintainability.
6. Resolved issues with application form submission and validation, incorporating a custom deadline date picker, Zod form validation, and updates to the required documents section.
7. Added the application form and implemented the application creation process, integrating with the `useApply` hook and updating the `ProgramApplyPage`.
8. Implemented create and update application functionality, including a new `CreateApplicationForm` component, enhanced `useApply` hook, and backend mutations for application statuses.
9. Developed application creation and validation helpers, with functions for validating university and program associations and preventing duplicate applications.
10. Implemented application document management features and validation, including new hooks and mutations for handling documents, validation for application ownership and document status, and enhancements to document creation and saving functionalities.
11. Removed the separate LOR table, merging all documents into `applicationDocuments` for a simplified structure.

12. Refactored the useDocumentEditor hook and document editor atom to remove demoMode state management, streamlining the document editing process.
13. Moved document formatting logic to a separate formatDocument utility to improve code reusability.
14. Implemented feedback submission functionality, including new FeedbackPage and FeedbackForm components and a custom useFeedback hook.
15. Enhanced feedback submission with validation and sanitization to prevent XSS attacks and ensure data integrity.
16. Replaced the toast implementation with the 'sonner' library for improved notifications and user feedback.
17. Implemented a sidebar toggle for mobile devices to enhance the navigation experience.
18. Discussed and planned LLM deployment strategy (Docker, HTTP requests).
19. Prepared for production deployment on Netlify, including Clerk and Convex setup.
20. Collaborated with Yue on Netlify deployment and domain linking.
21. Addressed large dataset rendering bugs.
22. Achieved HTTPS deployment.
23. Fixed Netlify deployment build test issues.

Work planned for next report:

1. Finalize the document generation system with a dialog-based UI.
2. Continue refining and testing the application document management features.
3. Finalize the feedback submission workflow and UI enhancements.
4. Optimize database queries and mutations for performance.
5. Address any remaining UI/UX issues.
6. Prepare the application for production deployment, including building a production database instance.
7. Implement delete functionality for applications and documents.
8. Add empty states for application and document pages.
9. Continue backend cleanup and bug fixes, particularly on the program search feature.

Responsibilities:

1. Database schema design and management using Convex.
2. Backend development and API design, with a focus on efficient data handling and security.
3. Implementation of application logic and features, including user input validation and data processing.
4. Code refactoring and optimization to improve maintainability and performance.
5. Collaboration with frontend developers to ensure seamless integration of UI components and backend functionality.
